## Animals That Walk on Water

Several animals possess the unique ability to walk or run across water surfaces. These creatures utilize specialized adaptations in their anatomy and physics to stay afloat and move swiftly. The most notable examples include basilisk lizards, water striders, and some insects.

### Basilisk Lizards: The "Jesus Christ" Lizards

Basilisk lizards (genus *Basiliscus*) are perhaps the most famous terrestrial animals known for their ability to run on water. They are native to Central America and are often called "Jesus lizards" due to this remarkable trait.

How do basilisk lizards walk on water?

- **Body Structure:** Their lightweight bodies and long, powerful hind legs give them the leverage needed to push against the water surface.
- **Speed and Motion:** They run at high speeds?up to 1.5 meters per second?generating enough force to create a temporary "waterproof" surface.
- **Surface Tension and Friction:** By rapidly moving their feet and spreading their toes, they increase surface area, distributing their weight and preventing them from sinking.

Key adaptations include:

- Large, fringed toes that act like paddles
- Low body weight relative to size
- Rapid limb movement

Water Striders and Insects

Water striders (family Gerridae) are insects that can skate across water surfaces with incredible ease.

Mechanisms enabling water surface movement:

- Surface Tension: Their legs are covered with tiny hairs that repel water, distributing their weight evenly across the surface.
- Leg Morphology: Long, hydrophobic legs increase surface area, providing buoyancy.
- Weight Distribution: They maintain a low center of gravity to stay balanced.

Summary of water-walking animals:

| Animal Type | Key Features | Surface Capabilities |

|-----|-----|-----|

| Basilisk Lizards | Lightweight, fringed toes, high speed | Run across water surface |

| Water Striders/Insects| Hydrophobic legs, surface tension support | Skate across water surface |

| Frogs and Toads | Strong hind legs, jumping ability | Not walking, but leaping onto water |

Animals That Climb Up Walls

Climbing vertical surfaces is a common trait among various animals, especially those that need to escape predators, hunt for prey, or access nesting sites. Their ability to adhere to walls involves specialized structures and behaviors.

Geckos: Masters of Wall Climbing

Geckos are perhaps the most studied animals for their wall-climbing abilities.

How do geckos climb walls?

- **Setae and Spatulae:** Their toes are covered with millions of microscopic hair-like structures called setae, which branch into even finer spatulae.
- **Van der Waals Forces:** These molecular attractions allow geckos to adhere to surfaces without glue or suction.
- **Surface Adaptation:** The density and flexibility of setae enable geckos to stick to rough or smooth surfaces.

Climbing process:

- Geckos press their toes against the surface.
- The setae make close contact, creating numerous tiny van der Waals interactions.
- They can detach and reattach their toes rapidly, enabling quick movement and climbing.

## Other Wall-Climbing Animals

- **Insects (e.g., ants, beetles):** Use tiny claws and adhesive pads to cling to surfaces.
- **Spiders:** Employ silk threads and adhesive pads for vertical movement.
- **Chameleons:** Use specialized toe pads and prehensile tails to climb trees and walls.

## Scientific Principles Behind These Abilities

Understanding the physics and biology of animal movement provides insights into how these animals perform such extraordinary feats.

### Surface Tension and Hydrophobicity

- Surface tension allows small animals to stay on water with minimal weight.
- Hydrophobic (water-repelling) structures prevent water from soaking into their bodies or limbs.

### Friction and Surface Area

- Increased surface area (e.g., fringed toes) enhances grip and buoyancy.
- Frictional forces between animal structures and surfaces facilitate movement.

### Van der Waals Forces

- Weak intermolecular forces that, when accumulated over millions of setae, create strong adhesion without chemical glue.

## Physics of Movement

- Momentum, limb speed, and body weight influence ability to walk on water.
- Rapid limb movement generates enough force to counteract gravity temporarily.

The extraordinary abilities to walk on water and climb up walls have fascinated humanity for centuries, inspiring countless stories, myths, and modern scientific inquiries. While these feats are often associated with superheroes or mythical creatures, certain animals in the natural world have evolved remarkable adaptations that allow them to perform seemingly impossible feats of movement—walking on water and scaling vertical surfaces. Understanding how these animals achieve such feats not only deepens our appreciation for nature's ingenuity but also opens avenues for biomimicry, robotics, and innovative design. This article explores these remarkable animal movements, focusing on how they walk on water and climb walls, the mechanisms behind these abilities, and how humans might learn from them.

## Walking on Water: The Natural Marvels

Walking on water appears like pure magic from an everyday perspective. Only a select few animals have mastered this challenge, and their success hinges on specialized adaptations. The most iconic example is the basilisk lizard, often called the "Jesus lizard," which can run across the surface of water for short distances.

## How Do Animals Walk on Water?

Animals that walk on water typically rely on a combination of physical adaptations, rapid movements, and surface tension principles. Their ability to stay afloat while moving rapidly is a delicate balance that involves several factors:

- Surface Tension and Density: Water's surface tension creates a "skin" that can support small, lightweight animals if they distribute their weight effectively.
- High-Speed Movement: Moving quickly reduces the downward force exerted on the water surface, preventing breaking through.
- Specialized Appendages: Enlarged, webbed, or fringed limbs increase surface area and distribute weight, helping animals stay on water.

## Notable Animals That Walk on Water

- Basilisk Lizard (*Basiliscus basiliscus*)

The most famous water-walker, capable of running across water for up to 4.5 meters (15 feet). This ability is primarily used to escape predators.

- Water Striders (Gerridae family)

Insects that skate across water surfaces using long, hydrophobic legs that distribute weight and leverage surface tension.

- Frogs (e.g., Tree Frogs)

Some frogs can perform "water walking" in a limited sense, aided by their webbed feet and lightweight bodies.

- Fishing Spiders (*Dysderoides* species)

Capable of walking on water to hunt for prey, thanks to their hydrophobic legs.

## Mechanics Behind Water Walking

The basilisk lizard's ability to walk on water is a complex interplay of physics and biology:

- **Rapid Leg Movements:** The lizard runs at high speed, generating enough upward force to counteract gravity momentarily.
- **Large, Fringed Toes:** The toes of the basilisk are fringed with scales that increase surface area, distributing weight and increasing buoyancy.
- **Hydrophobic Skin:** Their skin repels water, preventing them from becoming waterlogged.
- **Muscle Power:** Strong leg muscles facilitate quick, powerful strides necessary for rapid movement.

This combination of traits allows the basilisk to generate enough force and leverage surface tension to stay afloat temporarily.

## Climbing Up Walls: Vertical Mastery

The ability to scale vertical or even inverted surfaces is a hallmark of certain animals, especially insects, amphibians, and some mammals. These creatures have evolved specialized structures and behaviors that enable them to defy gravity.

## How Do Animals Climb Walls?
