1. **Supervised Learning:** Models learn from labeled datasets to predict outcomes. Example applications include spam detection and image classification.
2. **Unsupervised Learning:** Algorithms identify patterns or groupings in unlabeled data, such as customer segmentation or anomaly detection.
3. **Reinforcement Learning:** Systems learn by interacting with environments, receiving feedback in the form of rewards or penalties, used in robotics and game playing.

Core Concepts and Techniques

1. **Features and Labels:** Features are input variables; labels are the target outputs.

2. Training and Testing: Data is split into training sets for model learning and testing sets for evaluation.
3. Overfitting and Underfitting: Balancing model complexity to generalize well to unseen data.
4. Evaluation Metrics: Accuracy, precision, recall, F1-score, and others measure model performance.
